Standardise and Simplify Azure Virtual Desktop Image Management

- Create Virtual Machines, Snapshots & Images 堅 🗷
- Create Uniform Virtual Machine Scale Sets S
- Deploy, Re-Deploy, Re-Image, Update & Rollback Virtual Machine Scale Sets using Managed Images or Azure Gallery Images
- Scale Up / Down Change VM Size
- Scale In / Out Adjust Virtual Machine Scale Set VM instances
- Join Active Directory Domain during deployment / update
- AVD-Join Join AVD Host Pool during deployment / update 🕮
- AVD-Automate Schedule tasks for planned maintenance.
 - E.g. Image Updates, Power Management, Scheduled Reboot

Consistent repeatable process for Image Continuity

Create Virtual Machine
 Take a Snapshot
 Sysprep and create an Image
 Create Virtual Machine Scale Set
 Create Virtual Machine from Snapshot
 Take a Snapshot
 Sysprep and create an Image
 Update Virtual Machine Scale Set

1. Introduction

AVDManage leverages <u>Microsoft Azure Virtual Machine Scale Sets</u> to deploy, update and rollback Windows images to multiple uniform Virtual Machine instances.

Virtual Machine instances retain their machine identity when updating, re-imaging, re-deploying and rolling back. (Windows computername, Active Directory computername, AVD Session Host name)

Up to 1000 virtual machines may be deployed or updated from Azure Gallery Images or up to 600 virtual machines from a customised Windows Managed Image subject to Azure subscription quota and limits.

AVD-Join enables Scale Set Virtual Machine instances to join an Active Directory domain and an Azure Virtual Desktop host pool when deploying or updating Virtual Machine Scale Sets.

AVD-Automate enables tasks to be scheduled and assigned to Virtual Machine Scale Sets to Automate Tasks such as updating, restarting or power management.

AVDManage provides a simplified and consistent methodology and process for creating, updating, and deploying customised Windows images to Virtual Machine Scale Sets.

- 1. Create a Windows Master VM from an Azure Gallery Image
- 2. Configure the Master Image based on user desktop requirements
- 3. Create a Snapshot of the Master VM
- 4. Sysprep the Master VM
- 5. Create an Image from the sysprepped Master VM (master VM is deleted)
- 6. Deploy the Image to a new or existing Virtual Machine Scale Set

The Master VM can be recreated from the Snapshot that was created in step 3 enabling image control and consistency and continuity of future image updates.

VMs may be updated manually, or scheduled to update during planned maintenance windows using Azure Automation and **AVD-Automate**.

AVDManage can provision Virtual Machine Scale Sets in Automatic update mode however this is unlikely to be appropriate for an AVD host pool as user sessions would be interrupted during unscheduled automatic updates. It is recommended that Virtual Machine Scale Sets are deployed in Manual mode and **AVD-Automate** is used to deploy out-of-hours updates.

AVDManage supports Azure Virtual Desktop environments however **AVD-Join** and **AVD-Automate** are optional features therefore AVDManage may be used to manage image deployment to Virtual Machine Scale Sets for almost any Windows based image.

2. Requirements

2.1 Operating System

• Microsoft Windows 10 build 1607 or higher

2.2 Software

- Microsoft .Net Framework 4.7.2
- Microsoft Windows PowerShell 5.1 or higher
- <u>Microsoft Windows PowerShell Modules</u>
 - Az.Accounts 3.03+
 - o Az.Compute 8.2.0+
 - Az.DesktopVirtualization 4.3.1+
 - o Az.Resources 7.3.0
 - o Az.Automation 1.10.0
 - Az.Network 7.8.1

2.3 Azure

- An Azure Tenant and Microsoft Entra Directory
- An Azure Subscription
- Azure Resource Groups for:
 - Master VM, Snapshots and Images
 - Virtual Machine Scale Sets and Automation Account
 - AVD Host pools and Application Groups
- Azure Virtual Network and Subnet(s)
- Azure Virtual Desktop Provider, Workspace, Host Pool, Application Group
- Sufficient <u>Azure quota</u> to deploy the intended number of VMs
- All Azure Objects in the AVDManage configuration must be in the same Azure location

Network access (Port 443) to:

- management.azure.com
- login.microsoftonline.com
- portal.azure.com
- www.powershellgallery.com

2.4 Azure Permissions

(Broad Scope Permissions)

- Contributor permissions to all in-scope Resource Groups
- Network Contributor Permissions to the Virtual Network

(Narrow Scope Permissions)

| Resource | Permission |
|---------------------------------|---|
| Scale Sets Resource Group | Automation Contributor |
| | Virtual Machine Contributor |
| Virtual Machines Resource Group | Virtual Machine Contributor |
| | Disk Snapshot Contributor |
| | Microsoft.Compute/images/write |
| | Microsoft.Compute/images/read |
| | Microsoft.Compute/images/delete |
| AVD Resource Group | Desktop Virtualization Contributor |
| Virtual Network Resource Group | Microsoft.Resources/subscriptions/resourceGroups/read |
| | Microsoft.Network/virtualNetworks/read |
| | Microsoft.Network/virtualNetworks/subnets/join |

2.5 Microsoft Entra Permissions

- Application Administrator (Application.ReadWrite.All) to create the AVD-Join Service Principal
- Owner Role of the AVD Host Pool Resource Group to assign the 'Desktop Virtualization Contributor' role to **AVD-Join** and **AVD-Automate**
- Owner Role of the VMSS Resource Group to assign the 'Virtual Machine Contributor' role to AVD-Automate

Virtual desktop admins may be assigned the Owner role to the 'App Registration' after creation to administer the **AVD-Join** Service Principal on a per user basis.

2.6 Microsoft Active Directory

- Active Directory Domain
- Dedicated organisational unit for Master VM
- Dedicated organisational unit for each AVD Host Pool
- AD account to join VMs to the domain

2.7 Virtual Machines

If VMs will be joined to an AVD Host Pool with **AVD-Join**, install the following PowerShell Modules on the Master VM:

- Az.Accounts
- Az.DesktopVirtualization

Virtual Machines require network access to:

• The AVDJoin.ps1 PowerShell Script

https://raw.githubusercontent.com/ChawnLimited/AVDManage/refs/heads/main/AVDJoin.ps1

 Installation media for the Microsoft Remote Desktop Service Infrastructure Agent and Boot Agent

https://query.prod.cms.rt.microsoft.com/cms/api/am/binary/RWrmXv https://query.prod.cms.rt.microsoft.com/cms/api/am/binary/RWrxrH

AVDJoin.ps1 and Microsoft Remote Desktop Service source media are downloaded by Virtual Machines when deploying and updating.

3. Getting Started

The user performing these tasks should be an **Azure Subscription Owner** and an **Entra Global Administrator** to create:

- An Azure Group named **AVD-Admins**
- Resource Groups
- Service Principal AVD-Join and assign the Desktop Virtualization Contributor role to the AVD Resource Group
- Automation Account AVD-Automate and assign Desktop Virtualization Contributor role to the AVD Resource Group, and the Virtual Machine Contributor role to the VMSS Resource Group.

3.1 Create AVD-Admins Group

The **AVD-Admins** group may be synced from an Active Directory Domain using Microsoft Entra Connect, or manually created in Microsoft Entra.

Add required members to the **AVD-Admins** group.

3.2 Resource Groups & Roles

Create the following Resource Groups and assign Roles to the AVD-Admins group.

| Suggested Name | Purpose | AVD-Admins Roles |
|----------------|--|---|
| VMSS | Contains Virtual Machine Scale Sets and AVD-Automate Automation Account | Virtual Machine Contributor Automation Contributor |
| AVD | Contains AVD Host Pools, Application Groups and WorkSpaces | Desktop Virtualization Contributor |
| GOLD-VDA | Contains Master VMs, Snapshots and Images | Virtual Machine Contributor Disk Snapshot Contributor Image Contributor (9) |

Or You will need to create a Custom Role named Image Contributor with the following permissions:

- Microsoft.Compute/images/write
- Microsoft.Compute/images/read
- Microsoft.Compute/images/delete

AVD-Admins will require permissions to join VMs to a Virtual Subnet.

Create a Custom Role named **Network Joiner** with the following permissions.

- Microsoft.Network/virtualNetworks/read
- Microsoft.Network/virtualNetworks/subnets/read
- Microsoft.Network/virtualNetworks/subnets/join/action

Assign the **Network Joiner** custom role to **AVD-Admins** on the Resource Group containing your Virtual Network(s).

3.3 Check AVDManage Requirements

The user performing this task must be a Windows local administrator.

Open PowerShell as Administrator

Run

get-module -ListAvailable az.accounts,az.compute,az.DesktopVirtualization,az.resources,az.automation,az.network

If no modules are returned then run

Set-PSRepository -Name PSGallery -InstallationPolicy Trusted

If prompted to install the the Nuget Provider, type Y

After NuGet is installed, run

install-module az.accounts,az.compute,az.DesktopVirtualization,az.resources,az.automation,az.network

Re-run

get-module -ListAvailable az.accounts,az.compute,az.DesktopVirtualization,az.resources,az.automation,az.network

You should see all six required modules.

| 2 Administra | ator: Windows Pov | ve X + ~ | | | | |
|---|---|--|--|--|--|--|
| PS C:\Users\locadmin> get-module -ListAvailable az.accounts,az.compute,az.DesktopVirtualization,az.resources,az.automati on,az.network | | | | | | |
| Direct | ory: C:\Pro | gram Files\WindowsPowerShell\Modules | | | | |
| ModuleType | Version | Name | ExportedCommands | | | |
| Script Script Script Script Script Script | 3.0.4 1.10.0 8.3.0 4.3.1 7.8.1 7.4.0 | Az.Accounts Az.Automation Az.Compute Az.DesktopVirtualization Az.Network Az.Resources | {Disable-AzDataCollection, Disable-AzContextAutosave, Enab {Export-AzAutomationDscConfiguration, Export-AzAutomationD {Add-AzImageDataDisk, Add-AzVhd, Add-AzVMAdditionalUnatten {Disconnect-AzWvdUserSession, Expand-AzWvdMsixImage, Get-A {Add-AzApplicationGatewayAuthenticationCertificate, Add-Az {Export-AzResourceGroup, Export-AzTemplateSpec, Get-AzDeny | | | |

Check the .Net Framework Version

Run

Get-ChildItem 'HKLM: \SOFTWARE Microsoft NET Framework Setup NDP' -Recurse | Get-ItemProperty -Name version -EA 0 | Where { $.PSChildName -Match '^{?}S)p{L}' | Select PSChildName, version$

The output should be similar to below. Check that the .Net Framework Version is 4.72 or higher.

3.4 Install AVDManage

- Download AVDManage from <u>www.chawn.com/downloads/AVDManage.zip</u>
- Extract the MSI installer from the zip file.
- Install AVDManage.msi as an Administrator

3.4.1 Authentication

AVDManage will use your current Azure Credentials to authenticate. If you are not authenticated to Azure, in PowerShell run **Connect-AzAccount** and complete the authentication process and then launch AVDManage.

If you would prefer to specify your credentials every time you launch AVDManage then you need to disable <u>Web Account Manager</u> when authenticating to Azure.

In PowerShell, run

Update-AzConfig -EnableLoginByWam \$False

This will enforce browser authentication instead of using Web Account Manager. This is helpful for users who need to logon to multiple tenants. When AVDManage is launched, the default browser opens and presents the Azure authentication dialog.

3.5 Configure AVDManage

Authenticate to Azure as an Azure Subscription Owner and an Entra Global Administrator

| - | | |
|----|----|----|
| Co | nt | 10 |
| 00 | | IU |
| | | |

| Config | | |
|------------------------------|--------------|---|
| Config Name | Save Confid | a |
| Tenant ID | V Open Confi | q |
| Subscription | ~ | |
| Location | ~ | |
| Scale Set Resource Group | ~ | |
| Master VM Resource Group | ~ | |
| AVD Host Pool Resource Group | ~ | |

Configure AVDManage

- Provide a Config Name •
- Select the target Azure Tenant
- Select the target Azure Subscription
- Select the target Azure Location
- Select the Resource Group for Virtual Machine Scale Sets and the Automation Account
- Select the Resource Group for the Master VM(s), Snapshots and Images
- Select the Resource Group that contains your AVD host pools If you do not wish to use AVD-Join, just select the Master VM Resource Group

Save the configuration file.

AVDManage will open and display the following items.

Service Principals - This is a container for AVD-Join which joins VMs to AVD Host Pools

<ResourceGroupName> - VMSS - Resource Group containing:

Automation - A container for the Automation account. Scale Sets - A container for the Virtual Machine Scale Sets.

<ResourceGroupName> - GOLD-VDA - Resource Group containing:

Virtual Machines - A container for Master VM Virtual Machines

Snapshots - A container for Master VM snapshots

Images - A containers for Master VM images.

3.6 Create a Service Principal – AVD-Join (Optional)

If you want to join VMs to an AVD host pool, you will need to create an Azure Service Principal.

The Azure Service Principal is named **AVD-Join**.

AVD-Join is assigned the *Desktop Virtualization Contributor* role to the Resource Group containing AVD Host Pools. This enables **AVD-Join** to join and remove Session Hosts from the AVD Host Pools when deploying, or updating Virtual Machine Scale Sets.

| Right click the Service Principals node and select New Service Principal | Azure Service Principal VMSS New Service Principal Automation Scale Sets GOLD-VDA Virtual Machines Snapshots Images |
|---|--|
| Confirm that you want to create AVD-Join | New Service Principal X Are you sure that you want to create Service Principal: AVD-Join? A new Service Principal will be created will be assigned the Desktop Virtualization Contributor role to the AVD Resource Group. |
| | OK Cancel |
| A confirmation message is displayed and the Client Secret is placed onto the clipboard. Paste the Client Secret into a text file for later use | New Service Principal X AVD-Join created. The Client Secret: T0n8Q~ has been copied to your clipboard. Please save the Client Secret as it cannot be retrieved again after creation. |
| when configuring Scale Sets. | OK |
| AVD-Join is created. | Azure Service Principals AVD-Join AVD-Join AVD-Join AVD-Join Automation Scale Sets GOLD-VDA Virtual Machines Snapshots Images |

The AppID and Client Secret will be required when creating Scale Sets with **AVD-Join**.

The Client Secret will expire after 12 months. You can reset the Client Secret at any time however you must update all Scale Sets with the new Client Secret.

AVDManage users must be *Owners* of the **AVD-Join** App Registration in Microsoft Entra to reset the Client Secret.

- Locate the AVD-Join App Registration in the Entra portal
- Select Owners in the left pane

You cannot add the **AVD-Admins** Entra Group. Only named users can currently be assigned as *Owners*.

| AVD-Join Owners 🖉 ··· |
|---|
| + Add owners 🗊 Remove owners 🔊 Got feedback? |
| The users listed here can view and edit this application registration. Additionally, any user (may not be listed here) with administrative privileges to manage any application (e.g., Global Administrator, Cloud App Administrator etc.) can view and edit the application registrations. Currently, only individual users are supported as owners of applications. Assignment of groups as owners is not yet supported. If the user setting "Restrict access to Microsoft Entra ID administration portal" is set to Yes, non-admin users will not be able to use the Azure portal to manage the applications they own. Learn more |
| No owners have been assigned to this application. |
| Add owners |

• Add required owners

3.7 Create Automation Account – AVD-Automate (Optional)

An Automation Account may be used to run PowerShell scripts at specific times to Automate Tasks such as updating, restarting or power management of Virtual Machine Scale Sets.

Configuration Complete. AVD-Admins can now use all features of AVDManage.

You can distribute the config file to **AVD-Admins**, or they can create their own config file using identical parameters.

4. Create (Master) VM

The user performing these tasks should be a member of AVD-Admins.

Right click Virtual Machines and select New VM.

Supply parameters for the following properties.

VM Source

| This can be either an Azure | VM Source | Azure Gallery | ~ |
|-----------------------------|-----------|---------------------------------|----|
| Callery Intage, | | microsoftwindowsdesktop | ~ |
| | | office-365 | ~ |
| | | win11-23h2-avd-m365 | ~ |
| or a Managed Image. | VM Source | Managed Image | ~ |
| | | WIN11-GOLD-image-2024Sep23-1627 | ~ |
| | | | ft |

It is recommended that the Master VM is created from an Azure Gallery Image as Microsoft does not recommend deploying a Master VM from an image that has been previously sysprepped.

OS Disk Type

| This can either be Persistent | OS Disk Type | Persistent ~ |
|-------------------------------|---------------------|--|
| | Storage / Placement | ~ |
| | | Premium_LRS Standard_LRS StandardSSD_LRS |
| or <u>Ephemeral</u> . | OS Disk Type | Ephemeral ~ |
| | Storage / Placement | ~ |
| | | CacheDisk ResourceDisk |
| T1 - NA - (-) /NA ' () () | | |

The Master VM is must be created using a Persistent OS Disk as VMs with Ephemeral OS Disks cannot be shutdown, sysprepped or used to create Images.

(VM) Size

The Size of the VM is filtered based on the OS Disk Type.

| Size | | Standard_DS3_v2 | | | | \sim |
|-----------|----|-----------------------|-----|----------|-------|--------|
| vCPUs | 4 | OS Cache Disk Size GB | 172 | Max IOPS | 12800 | |
| Memory GB | 14 | Resource Disk Size GB | 28 | | | |

Virtual Network / Virtual Subnet

Select a Virtual Network and Virtual Subnet.

| Virtual Network | VirtNet-CTX | \sim |
|-----------------|-------------------------|--------|
| Virtual Subnet | Subnet103-10.0.103.0/24 | \sim |

VM Name

Maximum length: 15 characters

VM names can only contain alphanumeric characters and hyphens.

Local Administrator

The name of the Local Administrator Account. Maximum length: 20 characters

(Local Administrator) Password

Maximum length: 123 characters

The Local Administrator password must contain characters from at least three of the following categories. One upper case letter, one lower case letter, a number, one special character.

Make a note of the Local Administrator name and password. If the VM is recreated in the future from a snapshot, you will need the same credentials to logon.

Join Active Directory Domain (Optional)

Domain Name: The name of the target Active Directory Domain

Org Unit: The name of the target AD Organizational Unit in LDAP format

AD User: The userPrincipalName of a user with sufficient privileges to join the VM to the Domain

Password: Password of the AD User

It is not necessary to join an Active Directory Domain however it may simplify access to application resources while building the Master VM. It is recommended that the Master VM is removed from the Active Directory Domain before running sysprep on the Master VM.

A new job will be created to deploy the Virtual Machine

| Jobs | | | Refresh |
|---------------------|---------------------|----------|------------|
| Job Name | Start Time | End Time | Job Status |
| CreateVM:WIN11-GOLD | 23/09/2024 15:26:35 | | Running |

You can click Refresh to update the status of the job and right click the job to view its details.

When the job is complete, the Job Status will change to Completed.

| Jobs | | | Refresh |
|---------------------|---------------------|---------------------|------------|
| Job Name | Start Time | End Time | Job Status |
| CreateVM:WIN11-GOLD | 23/09/2024 15:26:35 | 23/09/2024 15:32:43 | Completed |

Estimated time to complete: 6 mins

4.1 Modify the Master VM

If you have a private network connection to Azure, you can RDP to the new VM.

Don't install the Remote Desktop Service Infrastructure Agent or Boot Agent. These will be deployed later with **AVD-Join** when deploying a Virtual Machine Scale Set.

If **AVD-Join** is required, <u>install</u> the following Windows PowerShell Modules on the Master VM to enable VMs to join an AVD host pool at startup:

- Az.Accounts
- Az.DesktopVirtualization

Standard modifications:

- Add / Remove required Applications and Features
- Remove unwanted Microsoft Store Apps
- Install required Language Packs
- Install all available Windows and Application updates
- Configure the Default User Profile
- Modify the All Users Start Menu
- Disable unnecessary Scheduled Tasks
- Disable unnecessary Services
- Enable required Services (Windows Search)
- Enable Firewall Rules (Domain Profile)
- Delete Temporary Files and Source Media on the OS Disk
- Apply known optimizations

Prevent Machine Password Changes

REG ADD

"HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Netlogon\Parameters" /v DisablePasswordChange /t REG_DWORD /d 1 /f

If a Master VM is domain joined, it will have a machine password which will change within a forty day window. If the domain joined Master VM is created from a snapshot in the future, it may have an old out-of-date machine password and fall out of the domain. Applying the registry setting above prevents this issue.

When you have made all required changes to the Master VM, shut the VM down using AVDManage so that the VM status is deallocated.

<u>Create an Azure Virtual Desktop golden image | Microsoft Learn</u> <u>Prepare and customize a VHD image of Azure Virtual Desktop - Azure | Microsoft Learn</u> <u>Recommended configuration for VDI desktops | Microsoft Learn</u> <u>Prepare a Windows VHD to upload to Azure - Azure Virtual Machines | Microsoft Learn</u> (Azure) Virtual Desktop Optimization Tool now available - Microsoft Community Hub

4.2 Snapshot the Master VM

A snapshot is required so that the Master VM can be recreated in the future in the same state as its last update.

After the snapshot has been created, the next step is to sysprep the Master VM which will render the Master VM unusable. Therefore the snapshot allows for the original VM to be recreated in the future.

Check the VM status is Deallocated.

Right click the VM and select Create Snapshot

Name

Maximum length: 80 characters

The name is auto-generated based on the name of the VM and the current date / time. It may be modified. Snapshot names can only contain Alphanumeric characters, hyphens and underscores.

Create Snapshot × Name WIN11-GOLD-snapshot-2024Sep13-0506 Storage Type Standard_LRS OK Cancel

Storage

Select from

- Standard_LRS
- Premium LRS
- Standard ZRS

The new Snapshot is displayed under the Snapshots node.

4.3 Sysprep the Master VM

Start the VM.

When the VM is running, RDP to the new VM.

If the VM is joined to an Active Directory Domain, <u>remove the VM from the Domain</u> and restart.

Open a command prompt as Administrator and run:

C:\Windows\System32\Sysprep\sysprep.exe /oobe /generalize /shutdown

After several minutes the VM will shut down.

After shutdown, the VM status will be stopped.

Use AVDManage to Stop the VM so that it is in a deallocated state.

AVDManage 1.0.2.0 Administration

It is recommended that a *Seal Script* is used to shut down and sysprep the VM. A seal script can perform tasks that affect the state of the VM.

The example script below removes non-essential directories, clears the event logs and then runs sysprep.

Clear folders
Remove-Item -Path C:\Packages\ -Recurse -Force -ErrorAction Ignore
Remove-Item -Path C:\WindowsAzure\Logs -Recurse -Force -ErrorAction Ignore
Stop-Service wuauserv -Force
Stop-Service bits -Force
Stop-Service msiserver -Force
Remove-Item -Path C:\Windows\SoftwareDistribution -Recurse -Force -ErrorAction Ignore
Remove-Item -Path C:\Windows\Panther -Recurse -Force -ErrorAction Ignore
#Clear Event Logs
wevtutil cl Application
wevtutil cl System
wevtutil cl Security
Run Sysprep
C:\Windows\System32\Sysprep\sysprep.exe /oobe /generalize /shutdown

4.4 Create Image of the Master VM

Check the VM status is Deallocated.

Right click the VM and select Create Image

Name

Maximum length: 80 characters

The name is auto-generated based on the name of the VM and the current date / time. It may be modified. Image names can only contain Alphanumeric characters, hyphens and underscores.

| 👽 Create Image | \times |
|---|----------|
| Name | |
| WIN11-GOLD-image-2024Sep23-1627 | |
| Storage Type | |
| Premium_LRS | \sim |
| The source VM will be'Generalized' and deleted after the image has bee created | n |
| OK Can | icel |

Storage

Select from

- Standard_LRS
- Premium_LRS
- Standard_ZRS

The VM will be marked as generalized before an Image is created and the VM is deleted.

The new Image is displayed under the Images node.

Estimate time to complete: 60 seconds

5. Create a Scale Set

Right Click Scale Sets and select New Scale Set

Supply parameters for the following properties.

VM Source

This can be either an Azure

| VM Source | Azure Gallery | \sim |
|---------------------|---|--|
| | microsoftwindowsdesktop | ~ |
| | office-365 | ~ |
| | win11-23h2-avd-m365 | ~ |
| | | |
| VM Source | Managed Image | ~ |
| | WIN11-GOLD-image-2024Sep23-1627 | ~ |
| | | |
| | | |
| OS Disk Type | Persistent | ~ |
| Storage / Placement | | ~ |
| | Premium_LRS Standard_LRS StandardSSD_LBS | |
| | VM Source VM Source OS Disk Type Storage / Placement | VM Source Azure Gallery microsoftwindowsdesktop office-365 win11-23h2-avd-m365 VM Source Managed Image WIN11-GOLD-image-2024Sep23-1627 OS Disk Type Persistent Storage / Placement Premium_LRS Standard_LRS Standard_LRS |

VM Source

or Ephemeral.

| OS Disk Type | Ephemeral ~ | • |
|---------------------|---------------------------|---|
| Storage / Placement | ~ | - |
| | CacheDisk ResourceDisk | |

(VM) Size

The Size of the VM is filtered based on the OS Disk Type.

| Size | | Standard_DS3_v2 | | | | < |
|-----------|----|-----------------------|-----|----------|-------|---|
| vCPUs | 4 | OS Cache Disk Size GB | 172 | Max IOPS | 12800 | |
| Memory GB | 14 | Resource Disk Size GB | 28 | | | |

Virtual Network / Virtual Subnet

Select a Virtual Network and Virtual Subnet.

Virtual Network VirtNet-CTX ~ Virtual Subnet Subnet103-10.0.103.0/24 ~

Scale Set Name

Maximum length: 15 characters Scale Set names can only contain Alphanumeric characters and hyphens.

Orchestration Mode

This cannot be modified. All Scale Sets are deployed in <u>Uniform</u> mode.

VM Instances

Up to 1000 VMs may be created from an Azure Gallery Image. Up to 600 VMs may be created from a Managed Image. (Subject to Azure Subscription limits & quotas)

Update Mode

<u>Manual</u> mode is preferred for AVD Scale Sets so that updates and maintenance can be scheduled for appropriate times using an Automation Account.

<u>Automatic</u> mode is available however the scale set makes no guarantees about the order of virtual machines being brought down. The scale set might take down all virtual machines at the same time to perform upgrades.

VM Name Prefix

Maximum length: 9 characters VM names can only contain alphanumeric characters and hyphens.

Local Administrator

The name of the Local Administrator Account. Maximum length: 20 characters

(Local Administrator) Password

Maximum length: 123 characters

The Local Administrator password must contain characters from at least three of the following categories. One upper case letter, one lower case letter, a number, one special character.

Join Active Directory Domain (Optional)

Domain Name: The name of the target Active Directory Domain **Org Unit:** The name of the target AD Organizational Unit in LDAP format **AD User:** The userPrincipalName of a user with sufficient privileges to join the VM to the

AD User: The userPrincipalName of a user with sufficient privileges to join the VM to the Domain

Password: Password of the AD User

Join AVD Host Pool (Optional)

You must have created the Service Principal **AVD-Join**. The AppID and Client Secret are required when joining an AVD Host Pool.

You must have created an AVD Host Pool in the AVD Resource Group.

You must enable and configure Join Active Directory Domain to enable this option.

Host Pool: Select a Host Pool name App ID: The App ID is auto-populated using the App ID of AVD-Join Client Secret: Paste the Client Secret which was provided when creating AVD-Join.

The time to create the Scale Set can vary depending on how many VMs are created and the VM Size.

When the Scale Set has been created, a new node will appear under Scale Sets.

Estimated time to complete: 6-8 minutes

6. Image Updates

The user performing these tasks should be a member of **AVD-Admins**.

Managed Images will require updating at least once per month.

Updates may include:

- Windows Updates
- Application Updates
- Add / Remove Applications
- Fixes to discovered issues

6.1 Recreate the Master VM

Right click Virtual Machines and select New VM.

VM Source

Select Snapshot then select the last known good snapshot.

Storage / Placement

The OS Disk Type is Persistent. Select a storage tier.

(VM) Size

Select a virtual machine size.

Virtual Network / Virtual Subnet

Select a Virtual Network and Virtual Subnet.

VM Name

The Master VM will have the same Windows computername as before so it is recommended to name the VM accordingly.

If the Master VM was previously domain joined when the snapshot was created, it will still be domain joined after creation.

Estimate time to complete: 3 minutes

| 🖳 Create VM | | × |
|-------------------------|--|--------|
| Resource Group | GOLD-VDA | |
| Location | westeurope | |
| VM Source | Snapshot | \sim |
| | WIN11-GOLD-snapshot-2024Sep13-0506 | \sim |
| | | |
| OS Disk Type | Persistent | \sim |
| Storage / Placement | Premium_LRS | \sim |
| Size | Standard_B2s | \sim |
| vCPUs 2 | OS Cache Disk Size GB 30 Max IOPS 1280 | |
| Memory MB 4 | Resource Disk Size GB 8 | |
| Virtual Network | VirtNet-CTX | \sim |

| VM Name | WIN11-GOLD | |
| Local Administrator | locadmin | |
| Password | | |
| 📃 Join Active Directory | Domain | |
| Domain Name | | |
| Org Unit | | |
| AD User | | |
| Password | | |
| | OK Cance | 1 |

6.2 Modify the Master VM

If you have a private network connection to Azure, you can RDP to the new VM.

Updates may include:

- Windows Updates
- Application Updates
- Add / Remove Applications
- Fixes to discovered issues

When applying Windows Updates and rebooting, the VM may not be contactable for several minutes.

When you have made all required changes to the Master VM, shut the VM down using AVDManage so that the VM status is deallocated.

6.3 Snapshot the Master VM

A snapshot is required so that the Master VM can be recreated in the future in the same state as its last update.

After the snapshot has been created, the next step is to sysprep the Master VM which will render the Master VM unusable. Therefore the snapshot allows for the original VM to be recreated in the future.

Check the VM status is Deallocated.

Right click the VM and select Create Snapshot

Name

Maximum length: 80 characters

The name is auto-generated based on the name of the VM and the current date / time. It may be modified. Snapshot names can only contain Alphanumeric characters, hyphens and underscores.

Create Snapshot × Name WIN11-GOLD-snapshot-2024Sep24-1555 Storage Type Standard_LRS ✓ OK Cancel

Storage

Select from

- Standard_LRS
- Premium_LRS
- Standard_ZRS

The new Snapshot is displayed under the Snapshots node.

Estimated time to complete: 10-20 seconds

6.4 Sysprep the Master VM

Start the VM.

When the VM is running, RDP to the new VM.

If the VM is joined to an Active Directory Domain, <u>remove the VM from the Domain</u> and restart.

Open a command prompt as Administrator and run a seal script or:

C:\Windows\System32\Sysprep\sysprep.exe /oobe /generalize /shutdown

| Sysprep is working | × |
|--|---|
| Processing generalize phase Sysprep plugins | |
| | |

After several minutes the VM will shutdown.

After shutdown, the VM status will be stopped.

Use AVDManage to Stop the VM so that it is in a deallocated state.

6.5 Create Image of the Master VM

Check the VM status is Deallocated.

Right click the VM and select Create Image

Name

Maximum length: 80 characters

The name is auto-generated based on the name of the VM and the current date / time. It may be modified. Image names can only contain Alphanumeric characters, hyphens and underscores.

| 🟆 Create Image | × |
|---|------------------------------------|
| Name | |
| WIN11-GOLD-image-2024Sep24-1615 | |
| Storage Type | |
| Premium_LRS | ~ |
| The source VM will be'Generalized' and deleted a created. | after the image has been OK Cancel |

Storage

Select from

- Standard_LRS
- Premium_LRS
- Standard_ZRS

The VM will be marked as generalized before an Image is created and the VM is deleted.

The new Image is displayed under the Images node.

Estimate time to complete: 60 seconds

7. Update a Scale Set

The user performing these tasks should be a member of **AVD-Admins**.

When a new image has been prepared, the Scale Set configuration may be updated.

Right click the Scale Set and select Modify Scale Set.

You can modify the:

- VM Source
- (VM) Size Scale Up
- (VM Instances) Scale Out

In this instance, the VM Source is being updated to the newer Managed Image.

If the Scale Set is configured to Join Active Directory, you can update the AD User and Password.

If you do not select the checkbox, the Active Directory configuration remains the same.

If the Scale Set is configured to Join and AVD Host Pool, you can update the AppID and Client Secret.

If you do not select the checkbox, the Join AVD configuration remains the same.

| 💶 Modify Scale Set | | | | | × |

| | AVD-Automa Scale Sets Corph DLD-VDA Virtual Ma Snapshot WIN1 | ate Modify ScaleSet Power Operations Delete Scale Set | • • | Update All Re-Deploy All |

When updating Ephemeral and Persistent Virtual Machine instances, they will retain their VMName, VM Instance name, Windows computername and Active Directory computername.

Immediate updating of VMs is unlikely to be appropriate if the VMs are hosting AVD sessions.

It is recommended that Scale Set updates are scheduled during a planned maintenance window using Azure Automation and *AVD-Automate*.

7.1 Create Update Runbook

Task-Update-SS.ps1 is used to create an Automation Task that updates all the VM Instances at the same time during a planned maintenance window. The VMs will be re-deployed with the new Scale Set configuration such as an updated Image.

Right Click AVD-Automate and select New Runbook.

Click Browse and select a Runbook script.

The Runbook name and Description are auto-filled but may be modified.

Click OK.

| New Runbook | | | |
|--------------|--------|----|--------|
| Runbook Name | | | |
| Description | | | |
| Script | | | |
| | Browse | | |
| | | ОК | Cancel |
| | | | .: |
| | | | |
| New Runbook | | | |
| | | | |

| Runbook Name | Task-Update-SS | | |
|--------------|---|--|--|
| Description | Update ScaleSet | | |
| Script | C:\Users\dg\AppData\Local\Chawn\AVDManage\Scripts\AVD-A | | |
| | Browse | | |
| | OK Cancel | | |
| | | | |

The new Runbook is visible when clicking on the AVD-Automate node.

| Automation Account | | | | | | | |
|--------------------|--|----------------------------|------------|--|-----------|--|----------|
| N | Name AVD-Automate Resource Group VMSS | | Ra | Role Assignments Role: Virtual Machine Contributor Besource Group: VMSS | | | |
| R | | | 11630 | | | Resource choup: VMSS Role: Desktop Virtualization Contributor | |
| L | ocation | westeurope | Rok | | | | |
| C | reated | 27/09/2024 16:54:49 +01:00 | | | Tresource | aloop. AVD | |
| 0 | bject ID | 7fd5b | | | | | |
| S | cheduled Ta | isks | | | | | |
| Γ | ID | RunBook | Schedule | AVD Host Poo | d | Scale Set | Next Run |
| F | Runbooks | | n . | | | | |
| | Name | | State | | | Description | |
| T | ask-Update-SS | | Published | | | Update ScaleSet | |

A single runbook can be applied to multiple Scale Sets.

Runbook scripts are stored in **%LOCALAPPDATA%\Chawn\AVDManage\Scripts\AVD-**Automate.

Additional Task Scripts will be made available at https://github.com/ChawnLimited/AVDManage.

| Runbook Script | Purpose |
|-------------------------------|---|
| Task-DisableLogons-SSAVD.ps1 | Disable AVD logons for Scale Set VM instances |
| Task-EnableLogons-SSAVD.ps1 | Enable AVD logons for Scale Set VM instances |
| Task-LogOffSessions-SSAVD.ps1 | Logoff all AVD sessions on Scale Set VM instances |
| Task-ReDeploy-SS.ps1 | Re-Deploy all Scale Set VM instances |
| Task-Relmage-SS.ps1 | Re-Image all Scale Set VM instances |
| Task-Restart-SS.ps1 | Restart all Scale Set VM instances |
| Task-Start-SS.ps1 | Start all Scale Set VM instances |
| Task-Stop-SS.ps1 | Stop all Scale Set VM instances |
| Task-Update-SS.ps1 | Update all Scale Set VM instances |

7.2 Create Update Automation Task

A Task is required to associate a Scale Set with a Runbook. The Runbook will execute at the time specified in the Task schedule.

Runbook: Task-Update-SS Parameters:

Target Scale Set Name: CorpMP Target AVD Host Pool: CorpMP Schedule: Weekly. Every Sunday at 1am

Right Click a Scale Set and select New Task.

- Enter a Task Name
- Select a Runbook
- The Scale Set and AVD Host Pool values are pre-filled.
- Adjust the Time Zone if necessary
- Specify a Start Time and Frequency.
- Click OK

| New Task | |
|---------------|------------------------|
| Task Name | Update CorpMP Weekly |
| Runbook | Task-Update-SS ~ |
| Scale Set | CorpMP |
| AVD Host Pool | CorpMP |
| Time Zone | GMT Standard Time 🗸 |
| Start Time | 13-Oct-2024 01:00:00 |
| Frequency | Weekly \sim |
| | 🗌 Monday 🔄 Friday |
| | 🗌 Tuesday 📄 Saturday |
| | 🗌 Wednesday 🛛 🗹 Sunday |
| | Thursday |
| | OK Cancel |
| | h. |

The new task is visible when clicking on the AVD-Automate node.

| Automation A | ccount | | | | | | |
|---------------------|----------------------------|----------------------|---|---|-------------------------|--|--|
| Name | AVD-Automate | Re | ole Assignments | Role: Virtual Machine Contributor Resource Group: VMSS | | | |
| Resource Group | VMSS | | Role: Desktop Virtualization Contributor Resource Group: AVD | | | | |
| Created | 27/09/2024 16:54:49 +01:00 | | | | | | |
| Object ID | 7fd5b | | | | | | |
| Scheduled Ta | Scheduled Tasks | | | | | | |
| ID | RunBook | Schedule | AVD Host Poo | ol Scale Set | Next Run | | |
| Ofd8cd3e-eeef-4601- | 80be Task-Update-SS | Update CorpMP Weekly | CorpMP | CorpMP | 13/10/2024 01:00:00 +01 | | |

You can right click the task to delete it or view further schedule details.

8. Reference

8.1 Virtual Machines

Only Microsoft Windows Virtual Machines may be created.

Virtual Machines may be created from:

- Azure Gallery Images
- Managed Images
- Snapshots

8.1.1 Configuration

All Virtual Machines (and Virtual machine Scale Set VM Instances) have the following configuration.

| PublicIP | None |
|-----------------------------|---------------|
| BootDiagnostics.Enabled | False |
| HyperVGeneration | V2 |
| EnableAcceleratedNetworking | False |
| NetworkSecurityGroups | None |
| ProvisionVMAgent | True |
| PatchMode | AutomaticByOS |
| SecurityType | Standard |

The following events may be logged due to the SecurityType as vTPM and SecureBoot are not enabled. These events may be ignored.

| Log: System | Source: TPM-WMI | Event ID: 1796 |
|--|--|-------------------------------|
| The Secure Boot update failed to enabled on this machine For m https://go.microsoft.com/fwlink/? | o update a Secure Boot variable hore information, please see Plinkid=2169931 | with error Secure Boot is not |

| Log: System | Source: Wininit | Event ID: 15 |
|---|------------------------------------|---------------------------------|
| Credential Guard and/or VBS Ke continuing without them. | ey Isolation are configured but th | e secure kernel is not running; |

8.1.2 OS Disk Type: Persistent vs Ephemeral

Most VMs will be created with a Persistent disk however VMs with <u>Ephemeral</u> disks may be created for short term testing.

VMs with Ephemeral disks may not be used to create snapshots or images.

8.1.3 Menu Actions

| Power - Start VM | Starts the VM. (Persistent only) |
|--------------------|---|
| Power - Restart VM | Restarts the VM. |
| Power - Stop VM | Stops and De-Allocates the VM. (Persistent only) |
| RDP Console | Attempts to connect via RDP using the VM IP Address. |
| Create Snapshot | Creates a Snapshot. The VM must be in a deallocated state. (Persistent only) |
| Restore Snapshot | Reverts the VM to the previous Snapshot State. The VM must be in a deallocated state. (Persistent only) |
| Create Image | Creates an Image of the VM. The VM should have been sysprepped before. The VM must be in a deallocated state. (Persistent only) |
| Delete VM | Deletes the VM, Disk and NIC |

8.2 Virtual Machine Scale Sets

Only Microsoft Windows Virtual Machines can be created.

Virtual Machine Scale Sets may be created from:

- Azure Gallery Images
- Managed Images

8.2.1 Orchestration Mode

Uniform: Optimized for large-scale stateless workloads with identical instances **Flexible:** Achieve high availability at scale with identical or multiple virtual machine types

AVDManage only created Virtual Machine Scale Sets in **Uniform** Orchestration mode. <u>Orchestration modes for Virtual Machine Scale Sets in Azure - Azure Virtual Machine Scale</u> <u>Sets | Microsoft Learn</u>

8.2.2 Update Mode

You can choose between Manual and Automatic modes.

Manual: You choose when to update the scale set instances. Nothing happens automatically to the existing virtual machines when changes occur to the scale set model. New instances added to the scale set use the most update-to-date model available.

Automatic: The scale set makes no guarantees about the order of virtual machines being brought down. The scale set might take down all virtual machines at the same time to perform upgrades

Manual update is preferred for Scale Sets hosting AVD sessions. **AVD-Automate** can be used to update VM instances during planned maintenance windows.

Rolling update mode is not supported by AVDMAnage.

<u>Upgrade policies for Virtual Machine Scale Sets (preview) - Azure Virtual Machine Scale Sets |</u> <u>Microsoft Learn</u>

8.2.3 Load Balancing

Virtual Machine Scale Sets are frequently created with an <u>Azure Load Balancer</u> to spread traffic across multiple VMs, such as a web server farm.

AVDManage doe note create any Load Balancers when creating Virtual Machine Scale Sets however you are free to configure your own Load Balancer in the Azure portal after VMSS creation.

8.2.4 OS Disk Type: Persistent vs Ephemeral

<u>Ephemeral OS disks</u> are created on the local virtual machine (VM) storage and not saved to the remote Azure Storage. Ephemeral OS disks work well for stateless workloads, where applications are tolerant of individual VM failures but are more affected by VM deployment time or reimaging of individual VM instances. With Ephemeral OS disk, you get lower read/write latency to the OS disk and faster VM reimage.

The key features of ephemeral disks are:

- Ideal for stateless applications.
- Supported by Marketplace, custom images, and by Azure Compute Gallery (formerly known as Shared Image Gallery).
- Ability to fast reset or reimage VMs and scale set instances to the original boot state.
- Lower latency, similar to a temporary disk.
- Ephemeral OS disks are free, you incur no storage cost for OS disks.
- Available in all Azure regions.

| | Persistent | Ephemeral |
|--------------------------|---|---|
| Size | All VM Sizes | Restricted by Cachedisk or ResourceDisk size |
| Persistence | OS disk data written to OS disk are stored in Azure Storage | Data written to OS disk is stored on local VM storage and isn't persisted to Azure Storage. |
| Stop/Start | Supported | Not supported. Always running. Cannot be deallocated. |
| ReDeploy | OS Disk is preserved | VM is re-deployed |
| Disk Storage Costs | Yes | No |

As stated above, Ephemeral disks are 'Ideal for stateless applications'.

However as AVDManage can redeploy Persistent and Ephemeral VM instances both Persistent and Ephemeral disks should be considered stateless.

VMs with Ephemeral disks can be slightly more complicated to manage.

Imagine you have a Scale Set with 10 VM instances all joined to an AVD Host Pool.

The Session Hosts are only required between 6am and 9pm therefore you can reduce PAYG costs by powering off the VM instances at 9pm and powering on at 5.30am.

This is not an issue for Persistent VMs. They can be powered off and will start with the same machine identity and computername at 5.30am.

Ephemeral VMs cannot be powered off so you would have to delete all VM instances at 9pm and recreate them at 5.30pm.

In both cases the AVD Host Pool would be operational however the Ephemeral VMs will have new machine identities and computernames. The old names will be left behind in Active Directory, the AVD Host Pool and Microsoft Entra resulting in increased redundant objects and administration.

If you wish to run Ephemeral VMs 24h/24h, they will maintain their identities when updating, reimaging and re-deploying.

chawn

AVDManage 1.0.2.0 Administration

8.2.5 Menu Actions

| New Scale Set | Create a new Scale Set |
|----------------------------|---|
| Power – Start All | Start all VM instances (Persistent only) |
| Power – Restart All | Restart all VM instances |
| Power - Stop All | Stop all VM instances (Persistent only) |
| Modify Scale Set | Modify and update the Scale Set configuration. VMImageSource VMSize VMInstances ADJoin Join-AVD |
| New Task | Create and schedule a new task |
| Operations – Update All | Rebuild all VM instances with the latest Scale Set configuration |
| Operations – Re-Deploy All | Deploy all VM instances to a new host with the existing VM instance configuration |
| Operations – Re-Image All | Rebuild all VM instances with the existing VM instance configuration |
| Delete Scale Set | Delete the Scale Set and all VM instances |

8.3 AVD-Join Service Principal

AVD-Join is an Entra Service Principal. It can be viewed as an App Registration in the Azure portal and as an Enterprise Application but this can only be located using the search bar.

The Client Secret is valid for 12 months. It can be reset using AVDManage if the user has been assigned as an owner of the **AVD-Join** App Registration.

| Service Principal | | | | |
|-------------------|---------------------|------------------|--|--|
| Name | AVD-Join | Role Assignments | Role: Desktop Virtualization Contributor | |
| Created | 26/09/2024 13:21:47 | | Resource Group: AVD | |
| App ID | 6b825511- | | | |
| Object ID | 528b93b4- | | | |
| Secret Expires | 26/09/2025 13:21:45 | | | |

The Secret Expires date colour will change to Red 37 days before expiry.

When creating a Scale Set, **AVD-Join** can be configured as a <u>CustomScriptExtension</u>.

The following parameters are included:

- AVD Host Pool to join
- AVD-Join AppID
- AVD-Join Client Secret

All parameters are created in ProtectedSettings. Protected settings are encrypted through a key known only to Azure and the VM.

After the VM has joined an Active Directory Domain, AVD-Join will download https://raw.githubusercontent.com/ChawnLimited/AVDManage/refs/heads/main/AVDJoin.ps1 AVDJoin.ps1

- Checks that the Microsoft RDS InfraStructure Agent is not already installed
- Checks that the VM is domain joined
- Checks required PS Modules are present
- Authenticates to Azure as AVD-Join
- Removes the existing VM from the AVDHostPool (if it exists)
- Generates a new AVD Registration Token if it has expired
- Download the Remote Desktop Services Infrastructure Agent & Boot Loader
- Join the AVDHostPool using the AVD Token
- Disconnects from Azure

AVDJoin.ps1, AVDJoin.log and source media and installation log files will be left in C:\Packages\Plugins\Microsoft.Compute.CustomScriptExtension\x.x.x\Downloads\x

CustomScriptExtension logs are located in

C:\WindowsAzure\Logs\Plugins\Microsoft.Compute.CustomScriptExtension\x.x.x

8.3.1 Menu Actions

| New Service Principal | Creates a new ServicePrincipal named AVD- Join and assigns the <i>Desktop Virtualization</i> <i>Contributor</i> role to the Resource Group containing AVD Host Pools Menu action is disabled after creation |
|-----------------------|---|
| Reset Client Secret | Generate a new Client Secret |
| Delete AVD-Join | Delete AVD-Join ServicePrincipal and and removes the Role assignments |

8.4 AVD-Automate Automation Account

| Automation A | ccount | | | | |
|--------------------|----------------------------|---------------|--|-----------------------------------|-------------------------|

AVD-Automate is an <u>Automation Account</u> and can invoke Automation Runbooks at scheduled times.

An Automation Runbook is a PowerShell script that is executed with parameters

AVD-Automate is a Managed Identity. A <u>managed identity</u> from Microsoft Entra ID allows your runbook to easily access other Microsoft Entra protected resources. The identity is managed by the Azure platform and doesn't require you to provision or rotate any secrets.

This allows AVD-Automate to perform tasks against Virtual Machine Scale Sets and AVD Host Pools.

Scripts are located in %LOCALAPPDATA%\Chawn\AVDManage\Scripts\AVD-Automate

Scripts are available to download from https://github.com/ChawnLimited/AVDManage

Tasks may be scheduled to run One Time, Daily, or Weekly on specific days.

8.4.1 Menu Actions

| New Automation Account | Creates a new Automation Account named AVD-Automate and assigns the Virtual Machine Contributor role to the Resource Group containing Virtual Machine Scale Sets, and the Desktop Virtualization Contributor role to the Resource Group containing AVD Host Pools Menu action is disabled after creation |
|---------------------------|---|
| Delete Automation Account | Deletes the AVD-Automate Automation Account and removes the Role assignments |

8.5 Snapshots

Snapshots will accumulate over time and incur storage costs.

It is recommended that the last three good snapshots are retained for rollback purposes.

8.5.1 Menu Actions

| Delete Snapshot | Deletes the Snapshot |
|-----------------|----------------------|
|-----------------|----------------------|

8.6 Images

Images will accumulate over time and incur storage costs.

It is recommended that the last three good Images are retained for rollback purposes.

Do not delete Images that are still in use by a Scale Set.

Use Premium storage for faster deployments particularly when using VMs with Ephemeral Disks.

8.6.1 Menu Actions

| Delete Image De | Deletes the Image |
|-----------------|-------------------|
|-----------------|-------------------|

8.7 PowerShell

Minimum PowerShell Version: 5.1

8.7.1 Module Installation for AVDManage

Install minimal PowerShell Modules for AVDManage.

Set-PSRepository -Name PSGallery -InstallationPolicy Trusted Install-Module Az.Accounts, Az.Compute, Az.DesktopVirtualization, Az.Resources, Az.Automation, Az.Network

Or install all Azure PowerShell Modules.

Set-PSRepository -Name PSGallery -InstallationPolicy Trusted Install-Module Az.*

Update all Azure PowerShell Modules.

Set-PSRepository -Name PSGallery -InstallationPolicy Trusted Update-Module Az.*

8.7.2 Module Installation for AVD-Join (Master VM)

Install minimal Powershell Modules for AVD-Join on the Master VM.

Set-PSRepository -Name PSGallery -InstallationPolicy Trusted Install-Module Az.Accounts, Az.DesktopVirtualization

Update Powershell Modules for AVD-Join on the Master VM.

Set-PSRepository -Name PSGallery -InstallationPolicy Trusted Update-Module Az.Accounts, Az.DesktopVirtualization

8.8 Login Issues

8.8.1 Browser

Ensure that you have a modern up to date browser installed and that it is set as the Default browser.

8.8.2 Authentication Error

If you continually receive the message even though Azure permissions are correct.

"You must be authenticated To Azure With sufficient privileges to continue. Please restart the application and authenticate when prompted"

| Authentication | × |
|---|---|
| You must be authenticated To Azure With sufficient priviledges to continue. Please restart the application and authenticate when prompted | |
| ОК |] |

Try the following:

8.8.3 Authenticate Manually

Open PowerShell and run

Connect-AzAccount

Complete the authentication process. Launch AVDManage.

8.8.4 Update PowerShell Modules

Ensure that required PowerShell modules, specifically Az.Accounts, are up to date.

8.8.5 Disable Web Account Manager

This will enforce browser authentication.

In PowerShell, run

Update-AzConfig -EnableLoginByWam \$False

This will enforce browser authentication instead of using <u>Web Account Manager</u>. This is helpful for users who need to logon to multiple tenants. When AVDManage is launched, the default browser opens and presents the Azure authentication dialog.

8.8.6 Set Default Subscription

Open PowerShell and run Connect-AzAccount

If you successfully authenticate, get the required Subscription ID

Get-AzSubscription

8.8.7 Corrupt PowerShell / Azure Profile

Make a backup copy of the following folders

- %USERPROFILE%\.Azure
- %LOCALAPPDATA%\.IdentityService

Close all browsers, PowerShell consoles and AVDManage.

Delete the contents of the following folders:

- %USERPROFILE%\.Azure
- %LOCALAPPDATA%\.IdentityService

Open Powershell and run Connect-AzAccount
